

Notes

The average daily growth rates are low in the Spring. The farm starts growing in excess of 40kgs/day from the 11-April on average.

The peak growth rates are from the start of May to the middle of June.

Growth rates reduce from the middle of June. This is as a result of the dry nature of the farm.

From September the growth rates remain above 40kg DM /day.

From the middle of October the growth rates start decreasing.

For the winters of 2014-2016 the farm was growing 5kgs Dm/day. But, the previous winters it didn't grow anything due to frost.
